Chemical Engineering and Nanotechnology

With our long history in heterogeneous catalysis and surface science, Michigan chemical engineers have been using nanotechnology well before it became a buzzword. New tools allow even better control of nanoparticle growth, shape and properties – and better characterization of the final products. We are developing nanotubes, nanoprobes, nanomaterials, nanocatalysts and nanostructures for a variety of applications in energy conversion, medicine and electronics, for example.

What is nanotechnology? Nanotechnology is science, engineering and technology conducted at the nanoscale, about 1 to 100 nanometers. How small is that? Pretty small: a single sheet of paper is about 100,000 nanometers thick! At the nano level, scientists and engineers look to control individual atoms and molecules to do some pretty amazing things.
