A programmable logic controller or programmable logic controller is an industrial digital computer which has been ruggedized and adapted for the control of manufacturing processes, such as assembly lines, or robotic devices, or any activity that requires high reliability, ease of programming and process fault diagnosis. PLCs can range from

A programmable logic device (PLD) is an electronic component used to build reconfigurable digital circuits. Unlike integrated circuits (IC) which consist of logic gates and have a fixed function, a PLD has an undefined function at the time of manufacture.

Next part of the control panel is a device that controls and monitors

the mechanical process. Let's talk about the PLC or

Programmable Logic Controller. The PLC is like the brain of the

entire process. The PLC will have a CPU where the logic program is

stored.
