This is the first book to describe the results from a British scheme to monitor butterflies. The Monitoring Scheme, initiated in 1976, is based on frequent counts at some 90 sites throughout Britain. The combined efforts of amateurs and professionals have thus produced a dataset with no equivalent elsewhere in the world.

Recording and monitoring carried out by volunteers is vital for the conservation of butterflies and moths. The current advice to stay at home as much as possible in order to limit the spread of coronavirus and local travel restrictions mean that some recording and monitoring activities are limited for now (see Butterfly Conservation guidance below). As government restrictions vary in different ...

Monitoring is usually motivated by one of two goals: (1) targeted monitoring of specific species or populations that are known to be in jeopardy or (2) general monitoring to track trends in the overall butterfly community.

Butterflies are the primary food source for some wasps and flies, whose tiny larvae hatch within butterfly eggs, caterpillars, or pupae and feed on their host. Because butterflies are sensitive to environmental change, scientists look to them as signals that indicate the health of the environment.

Most butterfly monitoring protocols rely on counts along transects (Pollard walks) to generate species abundance indices and track population trends. It is still too often ignored that a population count results from two processes: the biological process (true abundance) and the statistical process (our ability to properly quantify abundance).

## **Monitoring Butterfly Abundance: Beyond Pollard Walks**

Butterfly species composition and relative abundances are sampled using transect counts, modified from Pollard (1977). Transect routes are established as appropriate for each site, typically including distinct segments near the base of a sloped habitat, mid-slope, and along ridgetops.

methodologies, it can be concluded that the results and accuracy of count-based methods depend heavily on the ecology and behavior of the target species and the habitat type in which surveys are taken (Pellet et al. 2012).

Every five-years or so, Butterfly Conservation and its partners publish a 'state of the nation' assessment of the UK's butterflies. Drawing from our world-leading recording and monitoring schemes, these influential reports set out the key results for butterfly species, highlight the implications of recent research and policy initiatives, and make recommendations for the
